Work tracker

Objective

The goal is to provide reps with a trusted, real-time conversational assistant that improves service quality and efficiency by offering **contextual knowledge** and **executing tasks**. It operates as a **Master Orchestrator**, coordinating specialized agents (e.g., Billing, Product, Troubleshooting) to present a unified, accurate response.

NOTE: In our retail stores AI tools should be invisible to our customers

Milestones

1 – 3 months: Launch the Orchestrator with Product and Billing agents in a read-only side panel. Introduce multi-agent chaining, the Intent/Breadcrumb agent, and the Trace drawer for explainability.

3 - 12 months: Enable autonomous task execution, voice assistance, and predictive churn prevention alerts

UI & Interaction Requirements

The system follows a "trust-first" design, ensuring AI assists rather than dominates the rep's screen.

Primary Layout & Behavior

Companion Panel: A persistent, resizable right-side panel (occupying 25–35% of the screen) that auto-refreshes based on the active customer account.

Glanceable Insight Cards: The default interaction pattern is **cards, not chat**. Each card includes a **confidence score** (Low/Medium/High) and maximum 5 bullet points for fast scanning.

Agent Trace Drawer: To maintain trust, reps can expand a "trace" view to see exactly which agents were called and how they reached a specific recommendation.

Integration Features

Feature	Implementation
Smart Chips	Suggested prompt buttons (e.g., "Explain this bill") to trigger common workflows without typing.
Breadcrumb Banner	A read-only header showing the customer's recent journey (e.g., "Added iPhone 16 to cart yesterday").

Actionable Buttons	Inline buttons within AI cards to directly "Apply Plan," "Add Accessory," or "Send Script" to the customer.
Micro-Coaching	Subtle, non-nagging "Rep Agent" tips, such as suggesting a shift in phrasing to handle objections.

Use cases

Agent Glossary (for all use cases)

- **Intent Agent** – Interprets behavioral signals (web, app, store) to infer what the customer is trying to do right now.
- **Product Agent** – Maps customer intent + profile to the best device/plan/perk combinations.

- **Bill/Account Agent** – Analyzes billing history, usage patterns, and plan fit; surfaces savings or optimization opportunities.
- **Troubleshooting Agent** – Detects technical issues (coverage, device, setup) and suggests remedies.
- **Master Orchestrator** – Coordinates multiple agents in parallel and merges them into a single, rep-friendly view.

Use Case 1: The Prospect (New-to-Mobile)

1A. User Story

I want the **Intent Agent** to surface a customer's recent web activity and the **Account Agent** to identify cross-sell discounts,

So that I can welcome a Fios customer with a personalized mobile offer that eliminates the "discovery tax".

1B. Customer Scenario

- **Customer Profile:** A Fios-only customer visiting the store to explore mobile options.
- **Customer Information:** Jamie is a "Fios-only" household with 1Gb Fiber at a single address.

1C. AI Signals & Data Inputs

- Web activity:
  - Viewed iPhone 16 Pro trade-in values
  - Checked mobile coverage at their home address ~2 hours ago
- Account data:
  - Active Fios service (1Gb), eligible for Mobile + Home discount
- Store context:

	○ In-store visit, identified via QR / check-in / account lookup **1D. AI Behavior / Orchestration** ● Intent Agent ○ Surfaces “breadcrumbs” from web: devices, trade-in interest, coverage checks. ● Product Agent ○ Ranks iPhone 16 Pro as “Best Match” based on recent searches + trade-in profile. ● Account Agent ○ Detects eligibility for “Mobile + Home” and calculates $25/mo bundle discount. ● Output to Rep ○ A single “Ready-to-Use” card: ■ Recommended device: iPhone 16 Pro ■ Offer: $25/mo Mobile + Home discount ■ Rationale: “Based on your recent browsing and Fios account.”

1E. Rep Experience (Talk Track)

“Welcome back, Jamie! xxx.”

1F. Business Outcomes / Metrics

- Increase Fios-to-Mobile conversion rate
- Reduce average discovery time per interaction
- Increase attachment rate of Mobile + Home bundle

Journey Map: The "No Discovery Tax" Experience

Phase	1. **Digita**	2. **StoreA**	3. **TheCon**	4. **Conver**	5. **Post-V**

	Pre-Visit	**rrival**	**sultation**	**sion/Closing**	**isit Follow-Up**

	coverage.	QR code.	Fios status.	agreement.	"Finish Your Order" nudge.
AI Agents	**Intent Agent** logs specific device SKU & coverage check.	**Account Agent** links mobile lead to 1Gb Fios profile.	**Product Agent** generates "Best Match" card with $25 discount.	**Orchestrator** updates profile to "Integrated Mobile + Home."	**Retention Agent** triggers personalized setup/abandoned cart logic.

Rep POS View	*N/A*	**Notification:** "High-Intent Fios Customer Arrived."	**Ready-to-Use Card:** Shows $25/mo savings and trade-in value.	**Success Screen:** Displays total household savings.	**CRM Task:** "Follow up in 48h to ensure Fios + Mobile syncing."
Possible talk tracks	*N/A*	"Hi Jamie! Thanks for being a Fios 1Gig	"I see you were looking at the 16 Pro—let's get you that $25	"Your new combined bill is actually lower than separate	"I'm sending a summary to your app so you can track your bundle

		customer."	discount."	services."	savings."
Follow-Up Trigger	*N/A*	*N/A*	*N/A*	**Automated Email:** "Welcome to the Bundle" + setup guide.	**SMS Nudge:** (If no sale) "Still thinking about that $25/mo discount, Jamie?"

Use Case 2: The Multi-Line Customer (Family Account)

2A. User Story

As a retail representative,

I want the **Bill/Account Agent** to analyze household data usage and the **Product Agent** to recommend relevant digital perks,

So that I can provide a "ready-to-use" plan optimization that adds value without increasing the net cost.

2B. Customer Scenario

Customer Profile: An existing customer with 4 lines on an older "Start" plan.

Customer Information: Account holder with 4 active lines; high streaming data usage across the household.

2C. AI Signals & Data Inputs

- Billing: recurring data top-ups on 2 lines over last 2 cycles
- Subscriptions: multiple separate streaming services on file
- Behavior: Line 3 browsing gaming-optimized devices

2D. AI Behavior / Orchestration

- **Bill/Account Agent:**
    - Flags lines that are consistently buying extra data

	○ Calculates a recommended newer plan with more data at equal or lower cost ● **Product Agent:** ○ Recommends “Disney Bundle” perk to consolidate existing streaming spend ● **Intent Agent:** ○ Notes gaming behavior on Line 3 and suggests a gaming-optimized device option (optional upsell) ● **Output:** ○ One “Family Plan Optimization” card with: ■ Proposed new plan + Disney Bundle ■ Net monthly cost vs. today ■ Optional device rec for Line 3 **2E. Rep Experience (Talk Track)** "Hi there! xxxx"

2F. Business Outcomes / Metrics

- Higher migration to premium plans with perks
- Lower bill shock and top-up churn
- Increased perceived value for families

Phase	1. **Data Friction**	2. **POS Engagement**	3. **The "Silent" Fix**	4. **Value Pivot**	5. **The "Clean" Clo**

					s e
User Action	Household constantly hits data caps; Line 3 wants a new gaming phone.	Jamie visits to upgrade Line 3. Rep opens the account.	Rep adds the new device to the cart. An IMEI conflict/ system error triggers.	Jamie reviews the "Optimization" card showing better data for less money.	Jamie signs for the upgrade and the new "Unlimited" plan with perks.

	AI Agents	**Bill Agent** flags $30 in data top-ups over 2 months.	**Intent Agent** identifies Line 3's gaming behavior.	**Troubleshooting Agent** detects an IMEI "Stuck" status or "Device ID Mismatch."	**Product Agent** bundles the Disney Perk to replace Jamie's external sub.	**Orchestrator** wipes the old "Start" plan and applies the new promo.
	POS View	*N/A*	**Optimization Card:** "Switch to Unlimited Welco	**Auto-Fix Notification:** "IMEI Conflict Resolved.	**Comparison Table:** Current Bill vs.	**Success Screen:** "Total Household Savings:

		me + Disney Bundle."	Backend ticket cleared."	Optimized Bill.	$15/mo."
Rep Talk Track	*N/A*	"I see you're hitting data limits. Let’s look at a plan that actually saves you money."	"One sec—looks like a system hiccup with the device ID, but my assistant just cleared	"By moving to this new plan, we include Disney + for free, which wipes that $15/mo charge off your bank	"You've got the gaming phone, better data, and a lower total monthly spend."

			it for us."	statement."	

Use Case 3: The Multi-Address Customer (Mover)

3A. User Story

As a retail representative,

I want the **Master Orchestrator** to consolidate service data from multiple locations and the **Troubleshooting Agent** to identify signal gaps,

	So that I can solve the customer's technical pain points at their new home while managing their complex account. **Customer Profile:** A customer who just moved and maintains a secondary vacation property or home office. **3B. Customer Scenario** ● **Customer Profile:** A customer who just moved and maintains a secondary vacation property or home office. ● **Customer Information:** Jamie recently moved to a new primary address but kept service (mobile and/or Fios) at a previous location. **3C. AI Signals & Data Inputs** ● **Account & Address Data**

	○ Two active service locations on file (old address + new primary address) ○ Mixed services: mobile lines at both addresses, Fios only at the old address ● **Support & Feedback Signals** ○ Recent “poor reception” report at the new address via the mobile app ○ Prior contacts related to coverage or dropped calls ● **Network & Coverage Data** ○ RF / coverage map score for the new address ○ Known indoor coverage challenges in that area (e.g., building materials, rural location) **3D. AI Behavior / Orchestration** ● **Intent Agent** ○ Detects Jamie is in a move-related flow (address change completed recently, in-app support ticket for “poor reception” at new address). ● **Bill/Account Agent**

	○ Consolidates services from both addresses into a single, rep-friendly “multi-location” view: ■ Old address services (e.g., Fios + mobile lines) ■ New address services (e.g., mobile only) ■ Billing relationships (one bill vs multiple) ● **Troubleshooting Agent** ○ Correlates the “poor reception” complaint with: ■ Network performance at the new address ■ Device settings (Wi-Fi Calling off/on, VoLTE, etc.) ○ Determines that indoor coverage is borderline and that adding Fios + Wi-Fi Calling would materially improve experience. ● **Product Agent** ○ Checks Fios availability at the new address. ○ Suggests: ■ Fios installation at the new address ■ Explicit enablement of Wi-Fi Calling for key lines ■ Optional mesh/extender if needed for coverage inside the home. ● **Master Orchestrator** ○ Merges outputs from Intent, Bill/Account, Troubleshooting, and Product Agents into one “Mover Experience” card:

- Multi-address account snapshot
- Root cause: weak indoor cellular coverage at new address
- Recommended action bundle:
    - Add Fios at new address
    - Turn on Wi-Fi Calling
    - Optionally add a Wi-Fi extender
- Billing impact for adding Fios and any equipment.

3E. Rep Experience (Talk Track)

“xxx”

3F. Business Outcomes / Metrics

- Higher Fios attach rate for mover scenarios
- Reduced repeat calls/churn due to coverage complaints after a move
- Increased account stickiness by consolidating multiple addresses under one bill

- Improved NPS for customers in “life event” moments like moving

Phase	1. **Post-Move Friction**	2. **Store Check-In**	3. **Diagnostic Consultat**	4. **Unified Solution**	5. **Automated Resoluti**

			ion		**on**
User Action	Jamie moves to a new primary home but keeps the old condo. Experiences dropped calls at the	Jamie visits the store to "complain about service" or "fix the bill."	Jamie explains the dropped calls. Expects a generic "we're working on the towers" answer.	Jamie agrees to add Fios at the new house to enable Wi-Fi calling and mesh coverage.	Jamie leaves; receives a tech-install window and a remote "fix" for device settings.

	new house.				
AI Agents	**Troubleshooting Agent** runs a background RF (Radio Frequency) scan of the new address.	**Account Agent** consolidates the two addresses into a "Multi-Home" dashboard.	**Intent Agent** flags the "poor reception" ticket and correlates it to the new move.	**Product Agent** finds Fios availability and calculates the multi-address bundle.	**Master Orchestrator** auto-updates the backend ticket and schedules the Fios tech.

Rep POS View	*N/A*	**Alert:** "Mover Alert: Jamie has 2 locations. Recent signal issues at New Primary Address."	**Troubleshooting Card:** "Root Cause: Weak indoor signal. Solution: Wi-Fi Calling + Fios Fiber."	**Proposal:** "Bundle Fios at New Address for $25 discount + Free Extender."	**Confirmation:** "Ticket #8821 Closed. Fios Install set for Thursday."

	Rep Talk Track	*N/A*	"Congrats on the move, Jamie! I see you're managing both the old place and the new one now."	"I ran a quick diagnostic on your new address. It looks like the building materials are blocking the signal indoors."	"If we get Fios Fiber into that new house, your phones will jump onto Wi-Fi Calling automatically. It solves the signal issue instantly."	"I've updated your account to a single bill for both properties and scheduled your install. You're all set."

Core UI components & Patterns

Pattern	Requirement	Importance	Jira Issue	Notes

Companion Panel (Primary Container)	**Requirements** - Sticky right rail - Collapsible - Resizable - Keyboard shortcut toggle **Must Support** - Context refresh on customer change - Session memory - Agent responses and retrieval	HIGH		

Insight Cards (Default Pattern)	Important: Chat is NOT the default. Insights should surface automatically as cards. **Pattern** Each agent returns cards, not paragraphs. **Card Structure**			

	[Agent Icon **Maybe**] Bill Summary (Confidence: High) ● Top charge: $42 roaming ● Device protection: $18 ● Savings: $31/mo available [Explain] [Run Action] **Requirements** ● Max 5 bullets ● Plain language ● Action buttons ● Expandable ● Agent label visible			

	● Confidence indicator **Why** ● Faster scanning than chat ● Matches retail pace ● Reduces reading fatigue **1. Header (The "Trust" Layer)** ● **Agent Icon - (Optional)** [📄] **:** Clearly identifies which specialized agent (Billing, Product, or Troubleshootin			

	g) generated the card. ● **(Optional) Confidence Score:** A visual indicator (e.g., High/Medium/Low) to ensure the rep knows the reliability of the data before quoting it to a customer. **2. Body (The "Glanceable" Layer)** ● **Bullet Points only:** Per the requirements, long paragraphs are an **Anti-Pattern**. ● **Key Data Highlights:** Important figures like "$42 roaming" or "$31/mo savings" should be bolded to			

	allow for sub-2-second scanning. **3. Footer (The "Action" Layer)** - `[Explain]` **(The Trace):** Opens the **Trace Drawer** to show the logic/source behind the recommendation. - `[Run Action]` **(Task Execution):** A deep link that triggers a workflow (e.g., navigating to the roaming adjustment page or applying a discount). - `[Copy Script]` **(Verbatim):** Instantly copies a customer-ready			

	explanation to the clipboard or the chat input.			
Conversational Input (Secondary Pattern)	Chat used only when: ● Rep asks custom question ● Needs clarification ● Edge cases **Requirements** ● Bottom docked input ● Suggested prompts (“chips”) ● Voice input optional			

	● Multi-turn memory **Smart Prompts** Examples: ● “Explain this bill” ● “Best plan for family” ● “Troubleshoot device” ● “Savings options”			

Agent Trace Drawer (Explainability)	Critical for trust + compliance. **Pattern** Expandable section: “View agent steps” ✓ Intent Agent detected upgrade			

	✓ Product Agent retrieved plans ✓ Cross-Sell Agent recommended bundle **Requirements** ● Click to inspect each agent output ● Rerun agent button ● Copy raw response ● Show sources			

Actionable Quick Actions	AI should not just suggest — it should enable. **Pattern** Inline buttons: ● Apply Plan ● Add Accessory ● Send Script ● Open Order Flow ● Create Ticket **Requirements**			

	• Deep links into CRM workflows • Pre-filled forms • One-click when possible			
(P1) Coaching Overlay (Rep Agent)	Subtle, not nagging. **Pattern** Micro nudges near relevant cards.			

	Tip: Lead with “save $30/month” instead of price. **Requirements** ● Non-blocking ● Dismissible ● Tone: supportive ● Max 1–2 tips per session			

(P1) Breadcrumb Context Header	Shows what AI already knows so rep doesn’t repeat questions. **Pattern** Small banner at top: Customer viewed: iPhone 16 Pro • Added cart • Asked about trade-in yesterday			

	Requirements ● Read-only ● Auto-populated by Intent Agent ● Hover for detail			
Multi-Agent Aggregation View	When multiple agents respond, results should merge. **Pattern** Grouped cards:			

	Billing Insights Savings Options Recommended Bundles Suggested Script NOT: ● 4 separate chat messages			

Behavioral Patterns	**Auto-Suggest (Proactive)** When account loads: ● Intent agent runs ● Cards auto-populate ● No typing required **Interrupt Safe** ● Never block checkout/transaction ● Async loading			

	● Rep always stays in control **Graceful Failure** If agent fails: ● Show fallback text ● Provide manual link ● Never blank screen			

(P3) Product Card Bundle	**1. The "Why" Statement** Per the **Workspace Requirements**, the AI must always provide a reason for its suggestion. This "Why" field appears at the top of the body to give the rep immediate context (e.g., *"Customer viewed iPhone 16 Pro yesterday"*). **2. Bundle Logic (Multi-Agent Aggregation)**			

	The Product Card often merges data from multiple agents: ● **Offer Agent:** Pulls the $800 trade-in promo. ● **Product Agent:** Identifies the "Unlimited Ultimate" plan. ● **Perk Agent:** Suggests the Disney Bundle based on family demographics. **3. Dynamic Actions** ● `[Add to Cart]`**:** This is a "deep-link" action. Clicking this automatically updates the			

	Canvas (the left 70% of the screen) with the selected product, bypassing manual SKU searches. • `[Suggest Script]`: Provides a "benefit-led" talking point. Instead of "This plan costs $10 more," the script would say: *"Since you travel often, this plan includes international data at no extra cost, which actually saves you on roaming fees."*			

(P3) Supervised Reinforcement (Training and Feedback loop)	• Agents provide feedback: /  + correction • Why: Add depending where you are in the flow • Learn from real rep interactions

Question	Answer	Date Answered

Master Orchestrator

DM

By Delimar Melendez

5

Add a reaction

Role

Central intelligence that:

- **Interprets rep request**
- **Classifies intent**
- **Selects appropriate agents**
- **Executes single or multi-agent workflows**
- **Merges responses**
- **Maintains conversational memory**

Functional Requirements

Routing

- Intent classification
- Multi-agent chaining (parallel or sequential)
- Dynamic escalation rules
- Confidence-based fallback logic

Memory

- Session memory
- Breadcrumb history from prior touchpoints
- Cross-agent shared context

UI Requirements

- Display which agents were called
- Expandable “Agent Trace” view
- Ability to:
    - Revisit prior answers
    - Inspect each agent’s contribution
    - Re-run a specific agent
    - Override recommendations

Example Flow

Rep:

“Customer’s bill is high and wants to lower it. What can I do?”

Orchestrator:

1. **Calls Bill Agent → explain charges**
2. **Calls Saving Agent → cost reductions**
3. **Calls Cross-Sale Agent → bundle optimization**
4. **Merges into single response**
